Objectives of Section 4.2 Exercises

The purpose of 4.2 practice a exercises is to reinforce comprehension by applying theoretical knowledge to practical problems. These exercises encourage critical thinking and the development of problem-solving techniques. Mastery of these questions often translates to improved performance in assessments and real-world applications.

Step-by-Step Solutions to Common Questions

Providing 4.2 practice a answers requires clear, logical explanations that guide learners through each step of the problem-solving process. Step-by-step solutions break down complex problems into manageable parts, enhancing understanding and retention. This section illustrates how to approach typical questions methodically.

Example 1: Solving a Linear Equation

Consider the equation $3x + 5 = 20$. The goal is to find the value of x that satisfies this equation.

1. Subtract 5 from both sides: $3x + 5 - 5 = 20 - 5$, resulting in $3x = 15$.
2. Divide both sides by 3: $3x / 3 = 15 / 3$, yielding $x = 5$.
3. Verify the solution by substituting x back into the original equation.

This methodical approach exemplifies how 4.2 practice a answers clarify the solving process for linear equations.

Example 2: Simplifying an Algebraic Expression

Simplify the expression $2(x + 3) - 4x$.

1. Apply the distributive property: $2 * x + 2 * 3 - 4x = 2x + 6 - 4x$.
2. Combine like terms: $(2x - 4x) + 6 = -2x + 6$.
3. Present the simplified form: $-2x + 6$.

Example 3: Evaluating a Function

Given the function $f(x) = 2x^2 - 3x + 1$, find $f(3)$.

1. Substitute 3 in place of x : $2(3)^2 - 3(3) + 1$.
2. Calculate powers and products: $2 * 9 - 9 + 1 = 18 - 9 + 1$.
3. Sum the values: $18 - 9 + 1 = 10$.
4. Therefore, $f(3) = 10$.
