The worksheet details mechanisms such as the sodium-potassium pump and endocytosis, illustrating how cells maintain internal conditions that differ from their external environment. This section stresses the importance of ATP in driving transport proteins and maintaining homeostasis.

Osmosis and Water Balance

Osmosis, the diffusion of water through a selectively permeable membrane, is another vital topic. The worksheet covers how water movement affects cell volume and turgor pressure, explaining hypotonic, hypertonic, and isotonic solutions. Students learn to predict cellular responses to different environmental conditions based on osmotic principles.

Transport Proteins and Membrane Structure

The worksheet also explores the structure of the cell membrane, emphasizing the fluid mosaic model and the role of proteins embedded within the lipid

bilayer. It explains how channel proteins, carrier proteins, and pumps facilitate selective transport, ensuring that essential molecules enter cells while waste products exit.
