Example Questions and Explanations

Reviewing example ap bio unit 7 questions with detailed answers can clarify expectations and highlight important areas for study. Below are representative questions with explanations.

Example 1: DNA Replication

Question: Describe the role of DNA polymerase during DNA replication and explain why replication is considered semi-conservative.

Explanation: DNA polymerase synthesizes new DNA strands by adding complementary nucleotides to the template strand in the 5' to 3' direction. Replication is semi-conservative because each new DNA molecule consists of one original (parental) strand and one newly synthesized strand, preserving half of the original molecule in each daughter DNA.

Example 2: Gene Regulation

Question: Explain how the lac operon functions in *E. coli* to regulate gene expression in the presence and absence of lactose.

Explanation: The lac operon is an inducible operon that controls genes for lactose metabolism. In the absence of lactose, a repressor binds the operator, blocking transcription. When lactose is present, it binds the repressor, causing it to release from the operator, allowing RNA polymerase to transcribe the genes for lactose utilization.

Example 3: Biotechnology Application

Question: What is the purpose of gel electrophoresis in DNA analysis, and how can results be interpreted?

Explanation: Gel electrophoresis separates DNA fragments based on size by applying an electric current through a gel matrix. Smaller fragments move faster and farther through the gel. The pattern of bands can be used to compare DNA samples, identify genetic markers, or verify successful PCR amplification.

Example 4: Mutation Impact

Question: Describe the difference between a point mutation and a frameshift mutation and their potential effects on protein synthesis.

Explanation: A point mutation involves a single nucleotide change, which may result in a silent, missense, or nonsense mutation. A frameshift mutation is caused by insertion or deletion of

nucleotides that shifts the reading frame, often leading to a completely different and nonfunctional protein. Frameshift mutations generally have more severe consequences than point mutations.

Frequently Asked Questions

What are the main topics covered in AP Biology Unit 7?

AP Biology Unit 7 primarily covers ecology, including topics such as populations, communities, ecosystems, energy flow, and conservation biology.

How does population ecology explain changes in population size?

Population ecology explains changes in population size through factors like birth rates, death rates, immigration, emigration, and carrying capacity, often modeled using exponential and logistic growth equations.

What is the difference between exponential and logistic growth in populations?

Exponential growth occurs when resources are unlimited, leading to rapid population increase, while logistic growth occurs when resources become limited, causing the population growth rate to slow and stabilize at the carrying capacity.

How do energy flow and nutrient cycles differ in an ecosystem?

Energy flow is a one-way process where energy moves through trophic levels and is eventually lost as heat, whereas nutrient cycles involve the recycling of chemical elements like carbon and nitrogen within the ecosystem.

What role do keystone species play in a community?

Keystone species have a disproportionately large impact on their community structure and biodiversity; their presence helps maintain the balance of ecosystems by influencing population sizes and resource availability.

How do invasive species affect native ecosystems?

Invasive species can disrupt native ecosystems by outcompeting native species for resources, altering habitat structures, and causing declines or extinctions of native organisms.

What are some examples of human impacts on ecosystems

discussed in AP Bio Unit 7?

Human impacts include habitat destruction, pollution, climate change, introduction of invasive species, and overexploitation, all of which can lead to loss of biodiversity and ecosystem instability.
