Frequently Asked Questions

What is the formula to calculate the electric field due to a point charge in AP Physics C Electricity and Magnetism?

The electric field E due to a point charge q at a distance r is given by $E = k * |q| / r^2$, where k is Coulomb's constant ($k \approx 8.99 \times 10^9 \text{ N}\cdot\text{m}^2/\text{C}^2$).

How do you determine the equivalent capacitance of capacitors connected in series?

For capacitors in series, the reciprocal of the equivalent capacitance C_{eq} is the sum of the reciprocals of individual capacitances: $1/C_{eq} = 1/C_1 + 1/C_2 + \dots + 1/C_n$.

What is the expression for the magnetic field at the center of a circular loop carrying current I ?

The magnetic field B at the center of a circular loop of radius r carrying current I is $B = (\mu_0 * I) / (2r)$, where μ_0 is the permeability of free space ($\mu_0 = 4\pi \times 10^{-7} \text{ T}\cdot\text{m/A}$).

In AP Physics C, how is the force on a charged particle moving in a magnetic field calculated?

The magnetic force F on a charge q moving with velocity v in a magnetic field B is given by the Lorentz force equation: $F = q(v \times B)$, where $\times$ denotes the cross product.

What is the relationship between electric potential difference and electric field in a uniform field?

The electric potential difference ΔV between two points separated by distance d in a uniform electric field E is $\Delta V = -E * d$, where the negative sign indicates the direction of decreasing potential.

How do you calculate the energy stored in a charged capacitor?

The energy U stored in a capacitor with capacitance C and voltage V across its plates is $U = \frac{1}{2} C V^2$.
