UNDERSTANDING THE CELL CYCLE

THE CELL CYCLE IS A CAREFULLY REGULATED SERIES OF EVENTS THAT A CELL UNDERGOES TO DUPLICATE AND DIVIDE INTO TWO DAUGHTER CELLS. IT CONSISTS OF DISTINCT PHASES: G1 (GAP 1), S (SYNTHESIS), G2 (GAP 2), AND M (MITOSIS). DURING G1, THE CELL GROWS AND PREPARES FOR DNA REPLICATION; IN THE S PHASE, DNA SYNTHESIS OCCURS; G2 INVOLVES FURTHER GROWTH AND PREPARATION FOR DIVISION; AND MITOSIS IS THE ACTUAL PROCESS OF CELL DIVISION. PROPER PROGRESSION THROUGH THESE PHASES ENSURES HEALTHY TISSUE GROWTH AND REPAIR. REGULATORY PROTEINS SUCH AS CYCLINS AND CYCLIN-DEPENDENT KINASES (CDKS) ORCHESTRATE THE TIMING AND FIDELITY OF THE CELL CYCLE. DISRUPTION IN THESE REGULATORY MECHANISMS CAN LEAD TO ABNORMAL CELL PROLIFERATION, WHICH IS CENTRAL TO CANCER DEVELOPMENT. UNDERSTANDING THE NORMAL CELL CYCLE IS ESSENTIAL FOR GRASPING HOW CANCER CELLS EVADE THESE CONTROLS.

PHASES OF THE CELL CYCLE

EACH PHASE OF THE CELL CYCLE PLAYS A CRUCIAL ROLE IN ENSURING THAT CELLS DIVIDE CORRECTLY AND MAINTAIN GENETIC STABILITY:

- **G1 PHASE:** CELL GROWTH AND PREPARATION FOR DNA REPLICATION.
- **S PHASE:** SYNTHESIS OF DNA, DOUBLING THE GENETIC MATERIAL.
- **G2 PHASE:** FINAL PREPARATION FOR MITOSIS, INCLUDING PROTEIN SYNTHESIS.
- **M PHASE:** MITOSIS, WHERE THE CELL DIVIDES ITS CHROMOSOMES AND SPLITS INTO TWO CELLS.
- **G0 PHASE:** A RESTING STATE WHERE CELLS EXIT THE CYCLE TEMPORARILY OR PERMANENTLY.

REGULATION OF THE CELL CYCLE

THE CELL CYCLE IS TIGHTLY REGULATED BY CHECKPOINTS THAT MONITOR DNA INTEGRITY AND PROPER CELL GROWTH. KEY MOLECULES SUCH AS CYCLINS AND CDKS DRIVE THE TRANSITIONS BETWEEN PHASES. WHEN DNA DAMAGE OR ERRORS ARE DETECTED, THESE CHECKPOINTS CAN HALT THE CYCLE TO ALLOW FOR REPAIR OR INITIATE PROGRAMMED CELL DEATH (APOPTOSIS) IF THE DAMAGE IS IRREPARABLE. THIS REGULATION IS VITAL FOR PREVENTING THE PROPAGATION OF MUTATIONS THAT COULD LEAD TO CANCER.

THE ROLE OF CELL CYCLE CHECKPOINTS IN CANCER PREVENTION

CELL CYCLE CHECKPOINTS ACT AS QUALITY CONTROL MECHANISMS TO ENSURE THAT CELLS ONLY DIVIDE WHEN CONDITIONS ARE OPTIMAL AND DNA IS INTACT. THEY ARE CRITICAL IN PREVENTING THE UNCONTROLLED CELL DIVISION CHARACTERISTIC OF CANCER. THE THREE MAIN CHECKPOINTS INCLUDE THE G1/S CHECKPOINT, THE G2/M CHECKPOINT, AND THE SPINDLE ASSEMBLY CHECKPOINT DURING MITOSIS. EACH CHECKPOINT ASSESSES DIFFERENT CRITERIA TO PREVENT DAMAGED OR INCOMPLETE CELLS FROM PROGRESSING FURTHER IN THE CYCLE.

G1/S CHECKPOINT

THIS CHECKPOINT EVALUATES WHETHER THE CELL HAS ADEQUATE NUTRIENTS, SIZE, AND UNDAMAGED DNA BEFORE COMMITTING TO DNA REPLICATION. TUMOR SUPPRESSOR PROTEINS, SUCH AS p53 AND RETINOBLASTOMA PROTEIN (Rb), PLAY ESSENTIAL ROLES HERE BY HALTING PROGRESSION IF ABNORMALITIES ARE DETECTED.

G2/M CHECKPOINT

BEFORE MITOSIS BEGINS, THIS CHECKPOINT VERIFIES THAT DNA REPLICATION IS COMPLETE AND THAT NO DNA DAMAGE EXISTS. IT ENSURES THAT CELLS WITH GENETIC ERRORS DO NOT DIVIDE, MAINTAINING GENOMIC INTEGRITY.

SPINDLE ASSEMBLY CHECKPOINT

DURING MITOSIS, THIS CHECKPOINT CONFIRMS THAT ALL CHROMOSOMES ARE CORRECTLY ATTACHED TO THE SPINDLE FIBERS BEFORE CHROMOSOME SEPARATION OCCURS. FAILURE IN THIS CHECKPOINT CAN LEAD TO ANEUPLOIDY, A COMMON FEATURE IN CANCER CELLS.

HOW CANCER DISRUPTS THE CELL CYCLE

CANCER ARISES WHEN MUTATIONS AND OTHER GENETIC ABNORMALITIES DISRUPT THE NORMAL CONTROL MECHANISMS OF THE CELL CYCLE, LEADING TO UNCHECKED CELL PROLIFERATION. MUTATIONS MAY ACTIVATE ONCOGENES, GENES THAT PROMOTE CELL DIVISION, OR INACTIVATE TUMOR SUPPRESSOR GENES THAT NORMALLY INHIBIT GROWTH. THESE ALTERATIONS ALLOW CANCER CELLS TO BYPASS CHECKPOINTS, EVADE APOPTOSIS, AND PROLIFERATE UNCONTROLLABLY. THE CANCER AND THE CELL CYCLE WORKSHEET TYPICALLY EXPLORES THESE DISRUPTIONS TO ILLUSTRATE HOW CANCEROUS TRANSFORMATIONS OCCUR AT THE MOLECULAR AND CELLULAR LEVELS.

ONCOGENES AND TUMOR SUPPRESSOR GENES

ONCOGENES RESULT FROM MUTATED PROTO-ONCOGENES AND DRIVE EXCESSIVE CELL DIVISION. EXAMPLES INCLUDE THE RAS GENE AND MYC. TUMOR SUPPRESSOR GENES, SUCH AS p53 AND Rb, NORMALLY PREVENT DAMAGED CELLS FROM DIVIDING. WHEN THESE GENES ARE INACTIVATED BY MUTATIONS, IT REMOVES CRITICAL BRAKES ON THE CELL CYCLE.

LOSS OF CELL CYCLE CONTROL IN CANCER

CANCER CELLS OFTEN EXHIBIT:

- OVEREXPRESSION OF CYCLINS AND CDKS, PUSHING CELLS THROUGH CHECKPOINTS PREMATURELY.
- DEFECTIVE DNA REPAIR MECHANISMS, ALLOWING MUTATIONS TO ACCUMULATE.
- RESISTANCE TO APOPTOSIS, ENABLING SURVIVAL DESPITE GENETIC DAMAGE.
- ANOMALIES IN CHROMOSOME NUMBER AND STRUCTURE, LEADING TO GENOMIC INSTABILITY.
