Examples of Easy Math Riddles with Answers

Below are several examples of easy math riddles with answers designed to illustrate different types and levels of difficulty. Each riddle is followed by a detailed explanation of the solution to enhance comprehension.

1.

Riddle: I am a three-digit number. My tens digit is five more than my ones digit, and my hundreds digit is eight less than my tens digit. What number am I?

Answer: 194

Explanation: Let the ones digit be x . Then the tens digit is $x + 5$, and the hundreds digit is $(x + 5) - 8 = x - 3$. Since these are digits, x must be 4 for the hundreds digit to be positive. So ones = 4, tens = 9, hundreds = 1, forming 194.

2.

Riddle: If two's company and three's a crowd, what are four and five?

Answer: Nine

Explanation: This riddle plays on words and numbers; the answer is the sum of four and five, which equals nine.

3.

Riddle: What number comes next in the sequence: 2, 4, 8, 16, ?

Answer: 32

Explanation: Each number is multiplied by two to get the next number, so $16 \times 2 = 32$.

4.

Riddle: Which weighs more: a pound of feathers or a pound of bricks?

Answer: They weigh the same.

Explanation: Both weigh one pound, so their weight is equal despite the difference in volume and density.

5.

Riddle: If you multiply me by any other number, the answer will always be the same. What number am I?

Answer: Zero

Explanation: Zero multiplied by any number results in zero.
