## **Frequently Asked Questions**

### **What is the main purpose of the Energy Skate Park simulation?**

The main purpose of the Energy Skate Park simulation is to help students understand the concepts of kinetic energy, potential energy, and mechanical energy conservation by allowing them to explore how energy changes as a skater moves along a track.

## **How does the height of the skate ramp affect the skater's potential energy?**

The height of the skate ramp directly affects the skater's gravitational potential energy; the higher the ramp, the greater the potential energy because potential energy is proportional to height ( $PE = mgh$ ).

## **What happens to the skater's kinetic energy as they go down the ramp?**

As the skater goes down the ramp, their potential energy is converted into kinetic energy, so their kinetic energy increases while potential energy decreases, keeping the total mechanical energy constant if we ignore friction.

## **How can you demonstrate the conservation of mechanical energy in the Energy Skate Park?**

You can demonstrate the conservation of mechanical energy by observing that the sum of potential and kinetic energy remains constant throughout the skater's motion, assuming no friction is present, meaning energy is transformed but not lost.

## **What effect does friction have in the Energy Skate Park simulation?**

Friction causes mechanical energy to be converted into thermal energy, which results in a decrease in the skater's total mechanical energy over time, causing the skater to eventually come to rest.
